AB - J55090347 Flexible tube comprises an inner porous tube of PTFE, a layer of fibres spirally wound about the inner tube, and an elastomer coating united to the outer surface of the fibre layer. Tube is made by (i) winding fibres spirally about a porous tube of PTFE; (ii) heat setting the fibres at  $\leq 327$  degrees C; (iii) coating the outer surface of the fibre layer with a soln. of an elastomer prepn. or a liq. elastomer prepn.; and (iv) drying.  
- Fibres of a fluororesin, polyester, polyethylene, PVC, etc. are used in mono- or pref. multifilament form. Elastomer coating is of fluororubber, silicone rubber, epichlorohydrin rubber, natural rubber, etc. Fluororubber, epichlorohydrin rubber, etc. are suitable for making a tube having low gas permeability.  
- Tube can be bent without collapsing or tearing and is useful for insertion or passage of substance, partic. for medical applications.
